

Efficient | Accurate | Instant

ANSRS In-Game Camera

The **ANSRS Camera** is a coach-controlled camera in the press box. It provides coaches with instant access to the in-game video most important to them to confirm their hunches and make game-winning adjustments throughout the game.

No Internet, No Problem: The ANSRS Camera is part of a self-contained local area network that allows coaches to instantly sync in-game video with play data across multiple computers in the press box. Internet connectivity is not necessary.

No Lag Time: The ANSRS Camera syncs with the game data in real time so in-game cut ups are available to review instantly throughout the game and at halftime.

Coaches Control: Coaches have complete control of the camera so they can zoom in and out and dictate the camera angles they want to see on any given play.

“With ANSRS we get play data and video instantly which allows us to quickly find the 4 or 5 plays we really want to watch at half time.”

Todd Moebes
Head Football Coach
Lockhart High School

ANSRS In-Game Camera

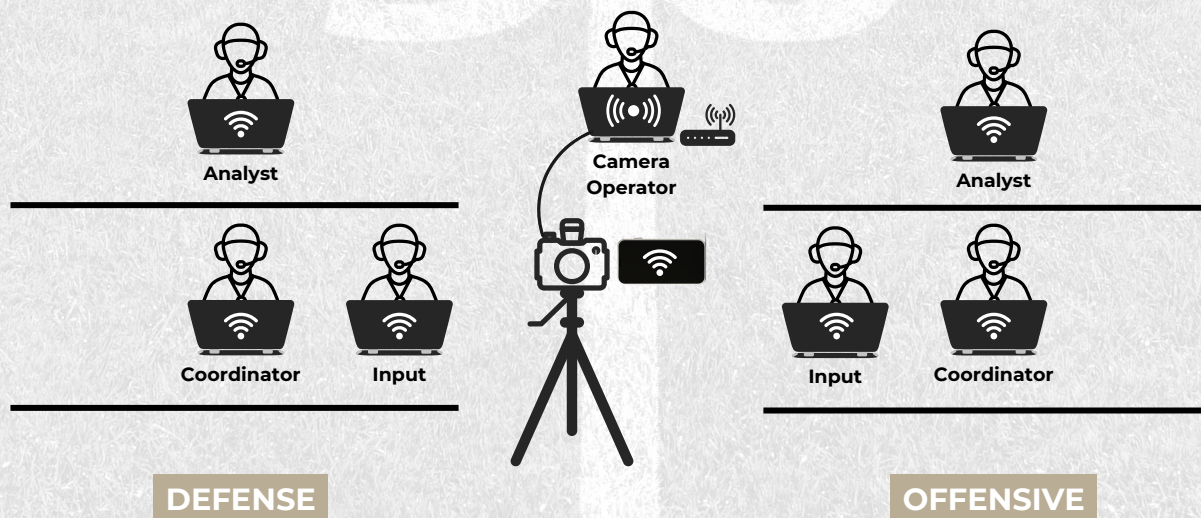

HOW IT WORKS

ANSRS provides a dedicated router to connect your coaching computers on your own secure local area network. Internet is not necessary.

Select one computer to be the "operator." Connect your video camera to that computer in the coaches' booth. At the beginning of the series indicate O/D/K and then the spacebar will serve as the stop and start function for the camera. Hit the spacebar to start recording a play and hit it again to stop the play.

For MacBooks on the same iCloud account with the device, you can connect an iPhone or iPad wirelessly to serve as the camera. Once again, the spacebar will start and stop the camera for each play.

ANSRS, a next-gen coach's tool delivering an immediate competitive advantage while **game planning, play calling and self scouting.**
